

- 7 **D** Let θ be the angle of one of the string with the horizontal. Since the system is in equilibrium, resolving the forces vertically,

$$2T \sin \theta = W$$

$$\Rightarrow \sin \theta = \frac{W}{2T}$$

When θ is very small, $\sin \theta < \frac{1}{2}$

$$\Rightarrow \frac{W}{2T} < \frac{1}{2}$$

$$\Rightarrow T > W$$
