

28	D	The K_{α} lines have a higher probability of occurring hence its intensity should be higher than the K_{β} lines.
29	B	Emission of one α-particle (${}^4_2\alpha$) causes the proton number to decrease by 2 and the neutron number to decrease by 2. Emission of one β-particle (${}^0_{-1}\beta$) causes the proton number to increase by 1 and the neutron number to decrease by 1.
30	C	Similar reasoning to why light emitted by an isolated atom reveals a line spectrum
