

		Therefore, total work done against electric field = -40 J.
21	C	By conservation of energy, for the electron to just reach plate AB (that is, $v_y = 0$), work done against electric force = loss in kinetic energy of electron $eV = \frac{1}{2} m_e (v \cos \theta)^2.$
22	A	Effective resistance is made up of copper and iron resistors in parallel
