

- 25** A current carrying wire is placed below a vertical coil in its plane, with current flowing towards the right as shown.

Which statement correctly describes the possible effect on the coil when the current in the wire increases?

- A** No current will be induced in the coil.
- B** A clockwise current will be induced in the coil.
- C** An anti-clockwise current will be induced in the coil.
- D** The current induced in the coil will be first anticlockwise and then clockwise.

26 The uniform wire AB has length 1.0 m and resistance of $10\ \Omega$. It is connected in series
