

Qn	Ans	Discussion
1	C	The object travels at the same speed. Hence, $v_f = v_i$. $\Delta v = v_f - v_i$ $= v_f + (-v_i)$  The diagram illustrates the vector addition $\Delta v = v_f + (-v_i)$. It shows a triangle where the top vertex is the common starting point for two vectors: v_f (black arrow pointing down and to the right) and $-v_i$ (black arrow pointing down and to the left). A red arrow labeled Δv connects the tip of $-v_i$ to the tip of v_f, representing the resultant vector.
2	A	For the upward motion, air resistance and gravitational force are both acting
