

25

A

According to Fleming's LHR, the electrons in the rotating metal disc experience a magnetic force directed **radially outward**.

Along the radius PQ, this force drives the electrons towards the rim of the disc, resulting in a net negative charge at the rim (P) and a net positive charge at the center (Q). Consequently, P has a lower electric potential than Q.

Along the radius PQ, the current flows from the rim (P) to the center (Q) within the disc.
