

27	Answer: A
	By Faraday's Law, $ E = \frac{N\Delta BA}{\Delta t}$ $= \frac{50(0.40)(0.08 \times 0.05)}{0.20}$ $= 0.40 \text{ V}$ By Lenz's Law, current flows in a direction to oppose the decrease in magnetic flux density (into page). This means that it should flow to produce more magnetic flux into page. By right hand grip rule, the induced current flows clockwise.
