

25	D	Using $e.m.f = -\frac{d\phi}{dt}$ When coil X is switched on, coil Y experiences an increase in magnetic flux linkage, there will be an e.m.f induced. When coil X remains switched on, magnetic flux linkage through coil Y remains constant, no e.m.f induced. When coil X is switched off, coil Y experiences a decrease in magnetic flux linkage, there will be an e.m.f induced but in the opposite direction.
