

Option D. If student makes X the subject first and adds all the percentage uncertainty.

- 4 X and Y are vectors. The magnitude of X is less than the magnitude of Y . The vectors are initially in opposite directions.

As Y is rotated through 180° , how does the magnitude of the vector $(X - Y)$ vary?

Ans: A

At an angle of 0° , X and Y are opposite in directions. Vector sum $(X - Y)$ is maximum.

At an angle of 180° , X and Y are in the same direction. Vector sum $(X - Y)$ is minimum.
