

25 D low intensity high freq can result in photoelectric effect, eliminate **A**

$$\left. \begin{array}{l} hf - \Phi = eV_s \\ h(2f) - \Phi \neq e(2V_s) \end{array} \right\} \text{eliminate } \mathbf{B}$$

statement is correct for **min frequency** so should have been *max* wavelength, eliminate **C**

intensity can mean increased energy per photon or more photons

26 A electron KE converted to photon:
