

		Since the potential at each end is the same, e.m.f. induced between the ends of the rod is zero.
26	B	Voltage across the secondary coil = $120/60 = 2V$ Current = $2/3.0 = 0.67 \text{ A}$
27	A	$eV = hc/\lambda$ Higher voltage means greater gain in kinetic energy for the electron and hence minimum
