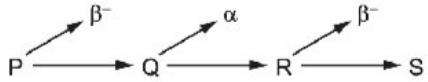
30 In a radioactive decay series, three successive decays each result in a particle being emitted.

The first decay results in the emission of a β^- particle. The second decay results in the emission of an α particle. The third decay results in the emission of another β^- particle.



Nuclides P and S are compared.

Which statement about S is correct?

A S and P are identical in all respects.

B S and P are isotopes of the same element.

C S is a different element of a lower atomic number.

D S is a different element of reduced mass.
